2003

- Certificazioni TÜV / KBA
- Fornite di connettori originali premontati
- Accesso agevolato per i gas di scarico: riscaldamento più rapido
- Rapido tempo di risposta al variare del titolo della miscela

- Fully approved by TÜV / KBA
- Supplied with OEM connectors factory-fitted
- Easy access for the exhaust gas giving rapid warm-up
- OEM quality and reliability

- TÜV geprüft
- Anschlußverbindungen in Originalausführung
- Vom Kraftfahrt - Bundesamt zugelassen (ABE)
- Erstausrüsterqualität

- Approuvée par le TÜV / KBA
- Fournie avec le connecteur Première Monte du constructeur, monté en usine
- Accès aisé des gaz d'échappement, permettant un échauffement rapide
- Qualité et fiabilité identiques aux spécifications Première Monte du constructeur

- Totalmente aprobados por TÜV / KBA
- Conectores originales instalados durante el proceso productivo
- Fácil acceso del gas de escape con el consecuente rápido calentamiento
- Calidad y fiabilidad de primer equipo

- Certificação TÜV / KBA
- Conectores originais
- Capacidade de leitura mais rápida: maior poder de aquecimento
- Tempo de resposta mais rápido

WHY LAMBDA SENSOR ARE FITTED

Everyone agrees that the amount of pollution produced by motor vehicles should be reduced. In order to encourage this governments have progressively introduced tougher and tougher exhaust gas emission legislation.

The most popular method used by vehicle manufacturers to reduce vehicle emissions is the three-way catalyst. This device converts the main pollutants in the exhaust gas to less harmful gases.

However the three-way catalyst only works efficiently if the air-fuel ratio can be kept within very tight limits. This is where the lambda sensor comes in.

The lambda sensor is typically situated in the exhaust pipe just before the three-way catalyst. The central element of the lambda sensor is exposed to the exhaust gas.

The lambda sensor continuously detects the composition of the exhaust gas. As the output from the sensor changes the ECU instructs the fuel mixing system to alter the mixture strength. This is known as closed-loop control and ensures that the mixture strength is always correct and ensures optimum catalyst efficiency. At the same time driving performance is assured. On the recent motorizations, in order to satisfy (EOBD) norms that demand also the control of the catalyst conversion capacity, it is generally placed, after this one, a second lambda sensor (rear sensor).

HOW THE LAMBDA SENSOR WORKS

There are two types of lambda sensors. They use different ceramic elements to detect the composition of the exhaust gas.

Zirconia Sensors: The outside of the Zirconia element is in contact with the exhaust gas; the inside is in contact with the air. Both sides of the element are coated with a thin platinum layer. Oxygen ions are able to pass through the element and deposit a charge on the platinum layer. These platinum layers are the electrodes that carry the sensors' signal from the sensor element to the sensors' lead wire.

The Zirconia element conducts oxygen ions above a temperature of about 300°C. Because of the special properties of the Zirconia element a voltage is generated if the oxygen concentration on the two sides of the element are different.

A low voltage is produced if the air-fuel mixture is lean and a high voltage is produced if it is too rich. There is a large change in voltage around 14.7:1 AFR (see diagram).

This AFR is known as λ 1.0 and is why the sensors are referred to as lambda sensors. The ECU uses the voltage produced by the lambda sensor to instruct the fuel mixing system to strengthen or weaken the mixture.

Since the sensor only produces a voltage when the element is above approx. 300°C, it takes the exhaust gas a little while to heat the element up to this temperature after the engine has been switched on. In order to reduce the time it takes for the sensor to start working most sensors today are fitted with an internal ceramic heater. These sensors have 3 or 4 lead wires. NTK's ceramic heaters utilise our long experience in thick film multi-layer technology, ensuring top performance and reliability.

Titania Sensors: The Titania element in these sensors does not produce a voltage like the Zirconia element does. Instead the electrical resistance of the Titania element changes according to the concentration of oxygen in the exhaust gas. There is a big change in the resistance of the element at Lambda 1.0.

Therefore when a voltage is applied to the element the output voltage changes depending on the oxygen concentration in the exhaust gas.

This signal from the sensor is used by the ECU for closed loop control. As Titania sensors do not need air on one side of the element they can be made smaller and are completely submergible.

The sensor element, its platinum electrodes and heater element are all mounted on a ceramic substrate using NTK's thick film multi-layer technology.

Titania and Zirconia sensor are not interchangeable due to the difference in size and the different control strategies that are used to interpret the sensor signal.

HOW TO TEST THE LAMBDA SENSOR

Failed or worn-out lambda sensors cause problems such as poor fuel economy, failed emission test, failure of the catalytic converter and poor driveability.

Before you can test the operation of the lambda sensor you will need an oscilloscope. You should first check that the basic engine setup is to the manufacturers' specification.

Then thoroughly warm up the engine remember the lambda sensor will only function once it is up to temperature.

Using the appropriate connecting device, connect the sensor output to your oscilloscope do not disconnect the sensor from the ECU. Run the engine at approx. 2,000 r.p.m. A properly functioning lambda sensor will show a rapidly fluctuating output signal between approximately 0.2 and 0.8 volt.

The time taken to change from 0.2 volt to 0.8 volt (lean to rich response time) should be about 300 milliseconds. The rich to lean response time should be similar.

If the sensor output is constant or the response time is too slow the sensor should be changed.

It is a good idea to check lambda sensor function at every tune-up and before submitting cars for emission tests.

A slow sensor will effect fuel economy. A new sensor will soon pay for itself by cutting fuel bills.

VISUAL INSPECTION

Visual inspection by itself is not usually sufficient to determine if a lambda sensor is functioning correctly. However, the lead wire and connector should be checked for damage. Any damage will interfere with the sensor signal.

The sensor body should be checked for dents which are a sign of mechanical shock which can crack the sensor element.

The appearance of the sensors' protection tube can give an indication of possible problems.

Excessive soot can clog the sensor and affect its response time. The mixture may be too rich or the sensor heater may be damaged. In either case the sensor should be changed.

Excessive white or grey deposits indicate that fuel additives are being used or the engine is burning oil. Certain components in the fuel additives and oil can contaminate the sensor element. The cause should be rectified and the sensor changed.

Shiny deposits indicate the presence of lead. Lead attacks the platinum on the sensor element and in the catalyst. The sensor should be changed and only unleaded fuel used.

LAMBDA-SONDEN FÜR OPTIMALE ABGASREDUZIERUNG

Die Automobilindustrie ist durch die gesetzlichen Abgasvorschriften verpflichtet, die Abgasemissionen zu reduzieren. Deshalb werden heute alle Fahrzeuge mit Otto-Motor serienmäßig mit einem Drei-Wege-Katalysator ausgerüstet. Der Katalysator wandelt die schädlichen Abgase in umweltverträgliche Gase um. Damit der Katalysator effektiv arbeitet, muß das Verhältnis von Kraftstoff und Luft exakt abgestimmt sein. Die Lambda-Sonde ermittelt kontinuierlich die Zusammensetzung der Abgase.

Die Lambda-Sonde befindet sich im vorderen Teil der Abgasanlage vor dem Katalysator. Sie mißt den Restsauerstoffgehalt im Abgas. Über ein Ausgangssignal regelt sie die Motorsteuerung, die das Kraftstoff-Luftgemisch mit dem Gemischbildner exakt einstellt. Dieser sogenannte geschlossene Regelkreis garantiert ein optimales Mischungsverhältnis. Gleichzeitig stellt er sowohl die optimale Konvertierungsrate des Katalysators als auch die beste Fahrleistung ein. Bei den neueren Motorisierungen wird eine zweite Lambdasonde nach dem Katalysator eingesetzt, um Abgasnormen (EOBD) zu erfüllen, gemäß denen auch die Wirkung des Katalysators überwacht werden muß.

FUNKTION UND TECHNIK

Es gibt zwei Typen von Lambda-Sonden. Sie unterscheiden sich durch die keramischen Elemente, mit denen die Zusammensetzung der Abgase gemessen werden.

Zirkondioxid-Sonden: Die Außenseite des Zirkondioxid-Elementes steht im direkten Kontakt zum Abgas. Die Innenseite hat Luftkontakt. Beide Seiten des Elementes sind mit einer dünnen Platinschicht überzogen. Sauerstoff-Ionen passieren das Element und hinterlassen eine elektrische Ladung auf der Platinschicht. Die Platinschicht fungiert als Elektrode; das SONDENSIGNAL wird vom Element zum Anschlußdraht der Sonde weitergeleitet.

Abgas

Das Zirkondioxid-Element wird für Sauerstoffionen ab einer Temperatur von ca. 300°C leitfähig. Ist die Sauerstoffkonzentration auf den beiden Seiten des Zirkondioxid-Elements unterschiedlich, entsteht aufgrund der besonderen Eigenschaften des Elements eine

Spannung. Bei einem mageren Verhältnis von Kraftstoff zu Luft wird eine geringe Spannung erzeugt. Ist das Verhältnis fett, ist die Spannung hoch. Der charakteristische Spannungssprung findet bei einem Kraftstoff-Luft-Verhältnis von ca. 1:14.7 statt (vgl. Bild III). Dieses Verhältnis kann auch mit der Luftzahl charakterisiert werden ($\lambda=1$ entspricht einem Kraftstoff-Luft-Verhältnis von 1:14.7, d.h. es findet eine vollständige Verbrennung statt). Daher der Name Lambda-Sonde.

Durch den Gemischbildner reguliert die Motorsteuerung das Verhältnis von Kraftstoff zu Luft. Die hierfür erforderlichen Informationen erhält die Steuerung durch die Lambda-Sonde.

Die Sonde erzeugt erst Spannung bei Erreichen ihrer Betriebstemperatur von über 300°C. Deshalb benötigt das Element nach dem Start des Motors eine gewisse Zeit, bis es durch die Abgase aufgeheizt ist.

Die meisten Sonden verfügen heute über einen internen Keramikheizer, der die Zeitspanne verkürzt, bis die Sonde ihre Arbeit aufnehmen kann. Die beheizten Sonden von NTK sind ein Beispiel für die langjährige Erfahrung auf dem Gebiet der Dickfilm-Mehrschicht-Technologie. Sie bieten die Garantie für Qualität und Zuverlässigkeit.

Titandioxid-Sonden: Das Titandioxid-Element erzeugt keine Spannung wie das Zirkondioxid-Element. Statt dessen ändert sich der elektrische Widerstand des Titandioxid-Elements in Abhängigkeit von der Sauerstoffkonzentration im Abgas. Bei Lambda 1,0 findet eine starke Veränderung des Widerstandes statt. Wird eine Spannung an das Element angelegt, ändert sich die Ausgangsspannung entsprechend der Sauerstoffkonzentration im Abgas. Die Titandioxid-Sonde benötigt im Vergleich zur Zirkondioxid-Sonde keine Referenzluft, da sie sich im Wirkmechanismus unterscheidet.

Deshalb fallen auch die Abmessungen der Titandioxid-Sonde kleiner aus. Das Sondenelement, seine Platinelektroden und das Heizelement werden mit der Dickfilm-Mehrschicht-Technologie von NTK auf einem Keramiksubstrat aufgebaut. Sonden aus Titandioxid und Zirkondioxid sind aufgrund ihrer unterschiedlichen Größe und Steuerstrategien, die zur Auswertung des SONDENSIGNALS verwendet werden, nicht austauschbar.

FUNKTIONSTESTS

Ausgefallene oder defekte Lambda-Sonden verursachen Probleme wie z.B. hohen Kraftstoffverbrauch, Ausfall und Beschädigung des Katalysators, schlechtes Fahrverhalten oder das Nichtbestehen des Abgastests.

Lambda-Sonden werden mit einem Oszilloskop getestet. Vor Testbeginn ist sicherzustellen, daß der Motor nach den Angaben des Herstellers eingestellt ist.

Danach muß der Motor auf Betriebstemperatur warmlaufen, da die Lambda-Sonde nur funktioniert, wenn sie die richtige Temperatur erreicht hat.

Mit der entsprechenden Anschlußvorrichtung wird der Sondausgang an das Oszilloskop angeschlossen. Die Sonde darf nicht von der Motorsteuerung getrennt werden.

Die Motordrehzahl sollte bei ca. 2.000 U/min liegen. Wenn die Lambda-Sonde richtig funktioniert, zeigt sich ein Spannungssprung zwischen ca. 0,2 und 0,8 Volt. Die Zeit, die für den Anstieg von 0,2 Volt auf 0,8 Volt benötigt wird (Reaktionszeit "mager-fett"), sollte ca. 300 Millisekunden betragen. Die Reaktionszeit "fettmager" liegt im gleichen Bereich.

Wenn der Sondausgang konstant oder die Reaktionszeit zu langsam ist, muß die Lambda-Sonde ausgetauscht werden.

Die Funktion der Lambda-Sonde sollte bei jeder Inspektion und vor der Abgabe des Autos zum Abgastest überprüft werden.

Eine langsame Sonde erhöht den Kraftstoffverbrauch und ist deshalb zu ersetzen.

SICHTPRÜFUNG

Sichtprüfung alleine reicht nicht aus, um die Funktionsfähigkeit einer Lambda-Sonde festzustellen. Sowohl Anschlußleitungen und Stecker als auch der Sondenkörper sind zu kontrollieren, denn auch Abweichungen in diesen Bereichen verfälschen das Sondersignal.

Beschädigungen des Sondenkörpers sind ein Zeichen für mechanische Stöße.

Auch der Zustand des Sondenschutzrohres kann Aufschluß über mögliche Fehlfunktionen geben.

Starke Rußablagerungen führen zur Verstopfung der Sonde und beeinträchtigen die Reaktionszeit. Das Kraftstoff-Luftverhältnis kann zu fett oder der Sensorheizer beschädigt sein. Auf jeden Fall sollte die Sonde gewechselt werden.

Starke weiße oder graue Ablagerungen weisen darauf hin, daß Kraftstoffzusätze verwendet werden oder der Motor Öl verbrennt. Bestimmte Komponenten in den Kraftstoffzusätzen und im Öl verschmutzen das Sonderelement. Die Ursache ist zu beseitigen und die Sonde auszutauschen.

Glänzende Ablagerungen sind ein Hinweis auf Blei im Kraftstoff. Blei greift das Platin auf dem Sonderelement und im Katalysator an. Die Sonde muß ersetzt werden. Nach dem Wechsel ist unbedingt auf die ausschließliche Verwendung von bleifreien Kraftstoffen zu achten.
